# D-Spray

Your personal ray of sunshine

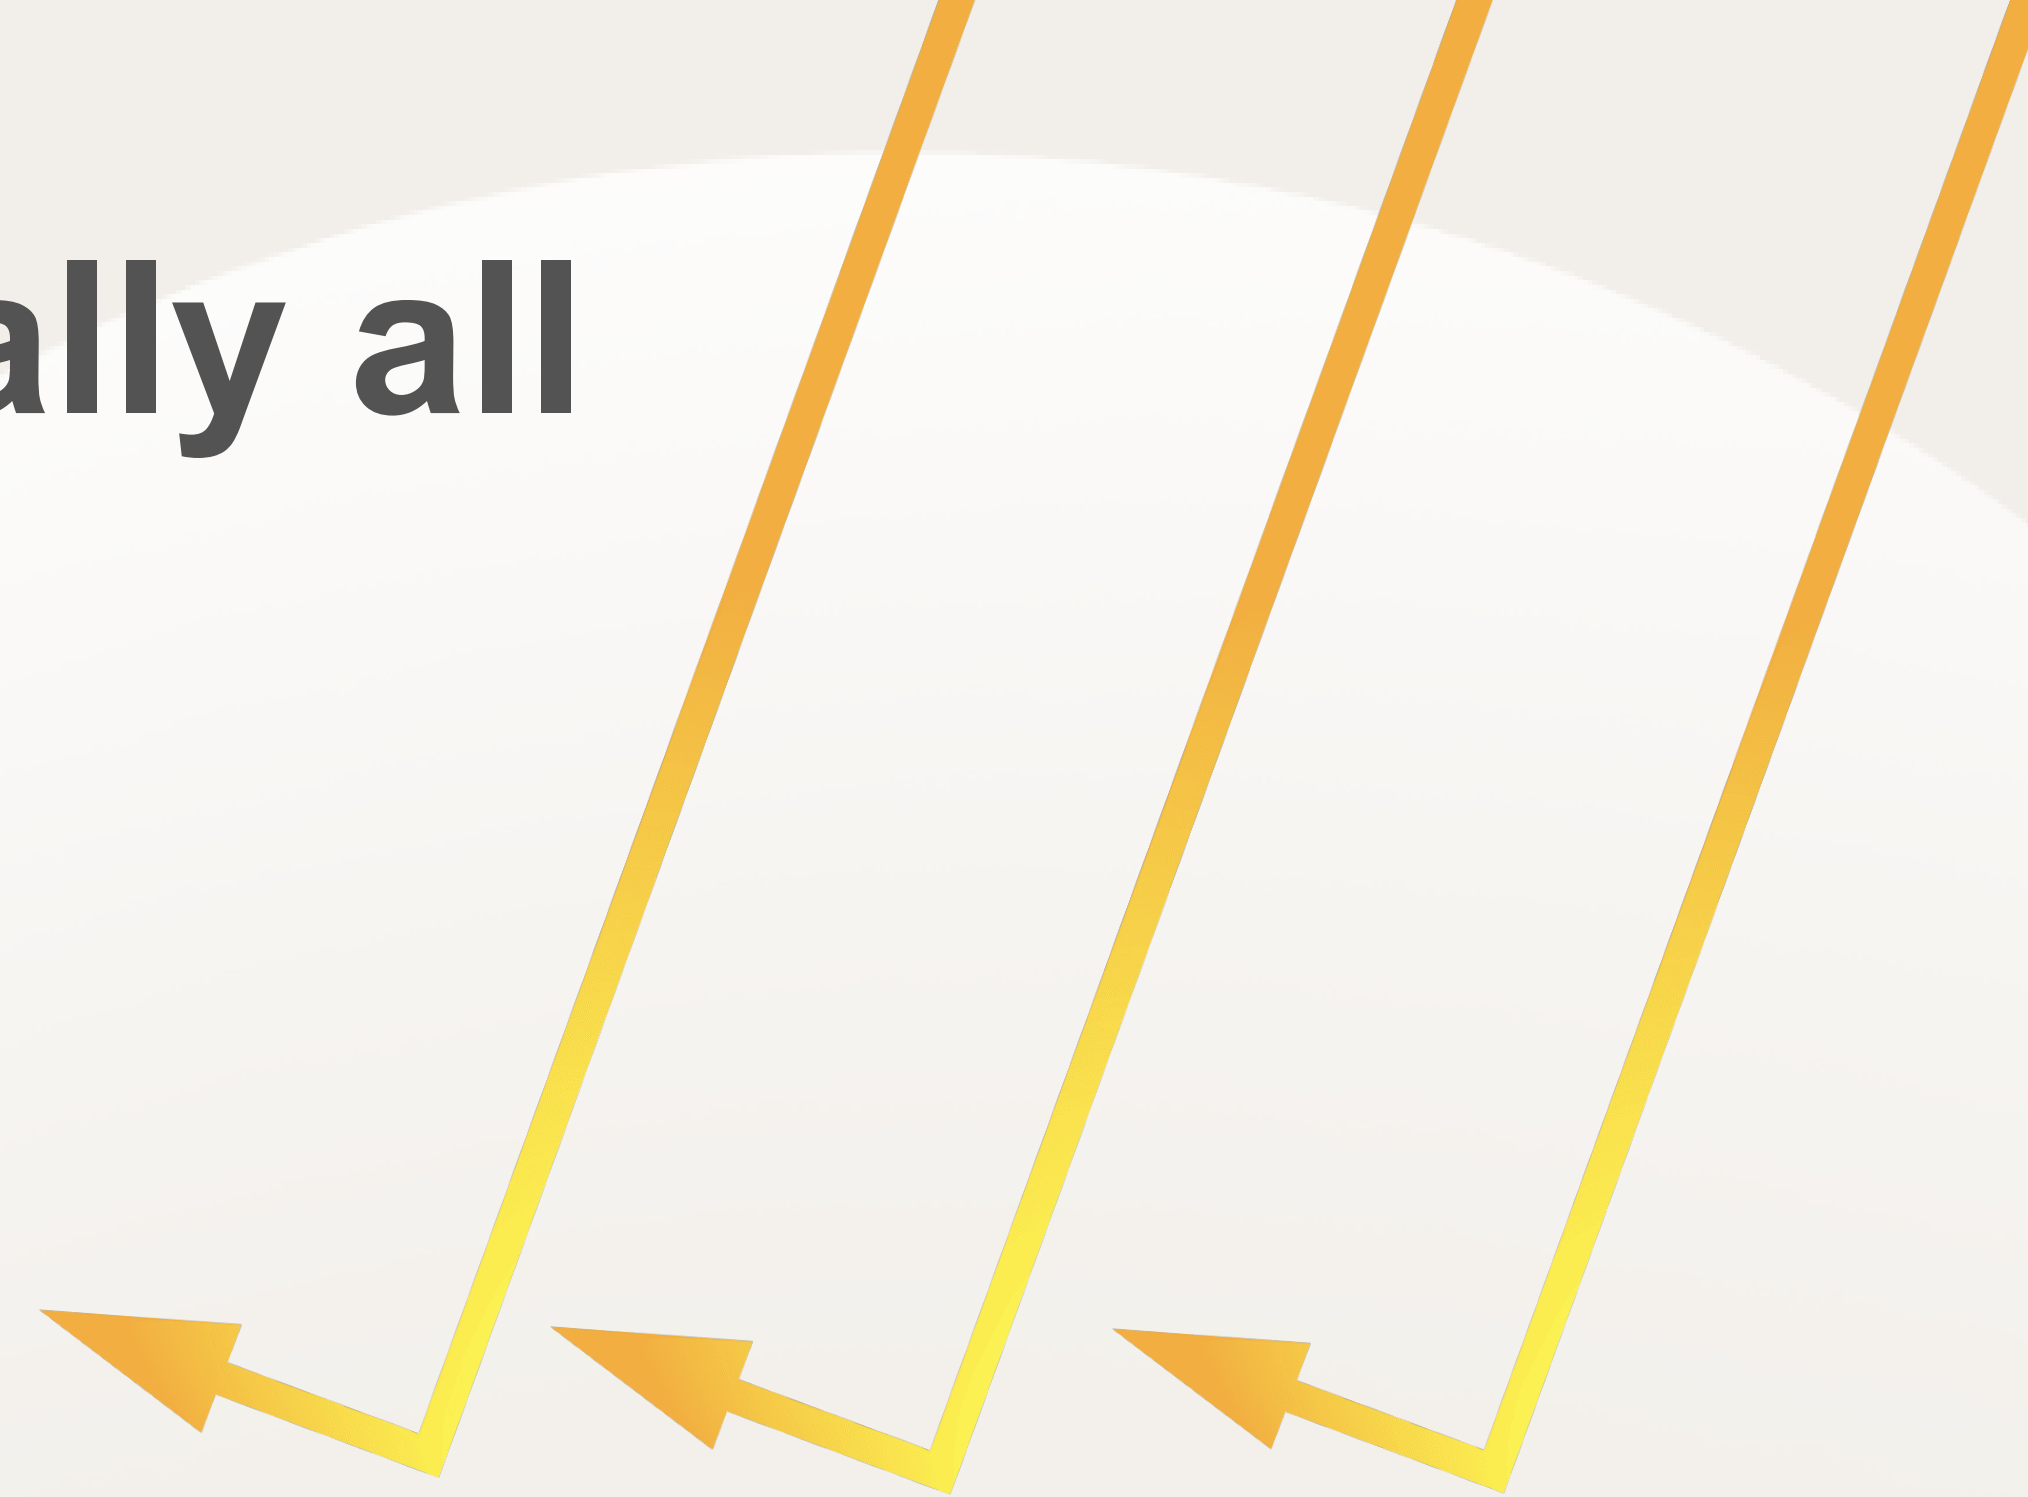

# Vitamin D regulates virtually all processes in the body

The body synthesizes this vitamin when exposed to sunlight.

Vitamin D can be difficult to obtain from food alone.

Up to **50%** of **UV** rays are blocked by urban dust, smog, and clouds.

# According to latest research, vitamin D deficiencies are found in people all over the world – even in countries with an abundance of sunlight.

■ Severe deficiency  
■ Low deficiency

Percentage of adults with vitamin D3 deficiency (below 25 nmol/l) or insufficiency (below 50 nmol/l)

In order for the body's organs and systems to function properly, Vitamin D has to enter the body in sufficient quantities and also be **adequately absorbed**.

**D-Spray contains MCT fatty acids that promote faster and more natural absorption of Vitamin D.**

# Sprays are an effective delivery method for vitamin D

The smallest particles of the spray easily penetrate into the bloodstream through the oral mucosa. Fine atomization increases the absorption area.

**The fat-soluble spray form of vitamin D is clinically proven\***

# Microfine mist delivery method provides many benefits:

Easily enters the bloodstream

Increases the area of absorption

Clinically proven to be effective

# D-Spray

Your personal ray  
of sunshine
